PROFESSIONAL SUMMARY

Java Backend Engineer with 2 years of experience building and supporting enterprise-scale backend systems in telecom environments. Skilled in microservices architecture, REST APIs, Spring Boot, Redis, Apache Kafka, asynchronous messaging, distributed caching, and containerized deployments using Docker and OpenShift. Hands-on experience with distributed systems, event-driven architectures, Saga Orchestration, and fault-tolerant workflows. Strong foundation in system design, performance optimization, and production support.

TECHNICAL SKILLS

Languages: Java, Python, C/C++

Backend & Distributed Systems: Java, Spring Boot, Microservices, REST APIs, Apache Kafka, JDBC, Servlets

Databases: PostgreSQL, Oracle, MongoDB, MySQL

Messaging & Integration: JMS/EMS, TIBCO BWCE, Flogo, JSON/XML Processing

Caching & Performance: Redis, TIBCO ActiveSpaces

DevOps & Deployment: Docker, OpenShift (OCP), CI/CD Basics, Linux

Testing & Monitoring: JUnit, Mockito, Postman, Elastic, Grafana

Tools: Git, GitHub, Maven, Swagger

Core Computer Science: Data Structures & Algorithms, Distributed Systems, Design Patterns, System Design

WORK EXPERIENCE

Software Engineer - Tech Mahindra Ltd., Hyderabad

(August 2024 – Present)

Project: IOH DMP Consolidation

- Developed and maintained enterprise backend microservices for a large-scale telecom platform using TIBCO BWCE and Flogo, supporting millions of subscriber transactions.
- Designed asynchronous JMS/EMS messaging workflows enabling reliable, decoupled communication across distributed enterprise systems.
- Built and optimized PostgreSQL and Oracle database integrations for high-volume transactional operations, improving query performance and data reliability.
- Engineered distributed caching using TIBCO ActiveSpaces, reducing database load and improving application response times across critical services.
- Built RESTful and SOAP APIs bridging legacy enterprise systems with modern microservices, streamlining cross-system integrations.
- Containerized backend services using Docker and managed deployment, configuration, and troubleshooting on Red Hat OpenShift (OCP) environments.
- Investigated and resolved SIT/UAT defects, production incidents, and performance bottlenecks, ensuring system stability across release cycles.
- Monitored application health, logs, and metrics via Elastic and Grafana, maintaining production readiness and proactive issue detection.

Recognition:

- Received the **"Pat on the Back" Award** for successfully delivering complex modules under tight deadlines while maintaining high-quality engineering standards.

International Onsite Experience – Indosat Ooredoo Hutchison (IOH), Jakarta, Indonesia

(April 2026 – May 2026)

Project: IOH DMP Consolidation

- Deployed and validated enterprise backend services in a live production telecom environment serving millions of active subscribers.
- Collaborated with client engineering teams on pre-production validation, deployment readiness, and production rollout across critical project phases.
- Performed real-time troubleshooting and incident resolution during go-live, ensuring zero-downtime delivery of mission-critical telecom workflows.
- Gained direct exposure to large-scale enterprise delivery processes and client-facing engineering operations in an international setting.

PROJECTS

Distributed Order Management System (Saga Orchestration Microservices)

Java | Spring Boot | Kafka | PostgreSQL | Distributed Systems

- Architected a distributed e-commerce order processing platform using the Saga Orchestration Pattern, coordinating transactions across Order, Inventory, Payment, and Orchestrator microservices.
- Implemented asynchronous event-driven communication via Apache Kafka with command and event topics, eliminating tight service coupling.
- Designed compensation workflows for distributed transaction failures — inventory release, payment refund, order cancellation — to maintain eventual consistency.
- Built resilient message processing with Dead Letter Queues (DLQ), retry mechanisms, and idempotent consumers to handle failures and duplicate Kafka deliveries.
- Implemented optimistic locking and concurrency control to prevent race conditions during inventory reservation and order state transitions.
- Added distributed tracing using correlation IDs and MDC-based structured logging to track requests across microservices.
- Designed for horizontal scalability — stateless services, idempotent consumers, and compensation workflows ensure correctness under partial failure.

Tech Stack: Java 17, Spring Boot, Apache Kafka, Spring Data JPA, Hibernate, PostgreSQL, Docker, REST APIs, Microservices, Saga Pattern

GITHUB: <https://github.com/dbalmoor/distributed-order-system>

🚧 Currently Building: API Gateway + Auth Platform

Java | Spring Boot | Spring Security | JWT | Redis | Rate Limiting

- Engineered a production-grade Auth Platform with JWT access/refresh token lifecycle, Redis-backed token revocation, role-based access control (RBAC), and Redis rate limiting.

(In progress — targeting completion Q3 2026)

EDUCATION

Bachelor of Technology (B.Tech) – Information Technology

Geethanjali College of Engineering and Technology, Hyderabad

2020 – 2024 | CGPA: 8.94 / 10

Intermediate (MPC – Mathematics, Physics, Chemistry)

Geethanjali College of Engineering and Technology, Hyderabad

2018 – 2020 | Percentage: 93.7%

Secondary School Certificate (SSC)
Narayana Concept School, Hyderabad
2018 | CGPA: 9.3 / 10
